Right to work in Hong Kong, open to relocation

About Me

Programming: Python (Pandas, NumPy, Scikit-learn, XGBoost, PyTorch), R, SQL

Analytics & ML: Machine Learning, Time Series Forecasting, A/B Testing, Optimization

Visualization: Tableau, Power BI, Plotly, Dash

Tools: Gurobi, Git, AWS (S3, EC2, SageMaker), Docker, Airflow

Languages: Fluent English and Cantonese (Written & Verbal), Conversational Mandarin

Education

MSc Industrial Engineering & Decision Analytics, HKUST (expected 2026) — top 5%

BSc Data Science, HKUST (2023) — First Class Honors, top 3 students

Honors & Awards

- Dean's List — HKUST (Fall 2021, Spring 2022, Fall 2022, Spring 2023)
- HKUST Data Science Competition — 1st Place (2023)
- MSc Scholarship — HKUST (2025)

Experience

Data Analytics Intern, TechFlow Solutions (Jun 2023 - Sep 2023)

- Built automated dashboards in Python (Plotly/Dash) for supply chain KPI tracking across 12+ metrics, reducing weekly reporting time from 8 hours to 30 minutes (94% reduction in reporting overhead)
- Analyzed customer churn patterns across 5,000+ users using Python (Pandas/NumPy), identifying retention factors that drove USD120K annual savings through targeted retention campaigns
- Collaborated with 3 product teams to integrate ML recommendations into dashboard workflows, enabling data-driven retention planning across product lines

Operations Analytics Intern, Global Logistics Corp (Jan 2023 - Apr 2023)

- Optimized route planning for 80+ delivery routes using Python optimization algorithms (Gurobi), reducing fuel costs by 18%
- Designed A/B testing framework for warehouse slotting optimization, increasing picking efficiency by 22%
- Presented findings to Director-level stakeholders, securing approval for USD250K process improvement initiative covering warehouse reorganization

Projects

Capstone Project: Demand Forecasting with LLM-Powered Feature Engineering

- Developed a time-series forecasting model using XGBoost and LLM-extracted features from unstructured demand notes, achieving 14% lower MAPE compared to baseline ARIMA on a 10K+ SKU dataset
- Deployed model to cloud function serving 500+ daily predictions

Supply Chain Optimization - HKUST Supply Chain Course

- Modeled facility location problem for regional distribution network using Gurobi and Python, recommending 3 facility closures and 2 new sites that saved USD2.1M annually in fixed costs
- Built sensitivity analysis for demand growth scenarios (5%, 10%, 15%)

Data Visualization Dashboard — HKUST Career Services

- Created interactive Tableau dashboard tracking 200+ student internship outcomes and salary progression
- Automated ETL pipeline using Python (Pandas) to clean and merge data from 5 university systems
- Dashboard adopted by career office for annual report — reduced manual reporting time by 75%
