Dear Human Resources Manager,

I am writing to apply for the Junior Data Scientist position at Lane Crawford, a role that closely aligns with my experience in statistical analysis, machine learning, and A/B testing. Your need to mine multiple data sets, build and optimize classifiers, and validate hypotheses to measure the impact of retail campaigns directly matches the analytical work I have delivered across my internships and academic projects.

At TechFlow Solutions, I built automated dashboards in Python (Plotly/Dash) for supply chain KPIs that reduced weekly reporting time from 8 hours to 30 minutes, and analyzed customer churn patterns across 5,000+ users that identified retention factors saving USD120K annually. This hands-on experience in manipulating large data sets and translating statistical findings into business outcomes prepared me to deliver the scalable enterprise analytics solutions your team requires.

At Global Logistics Corp, I designed an A/B testing framework for warehouse slotting using Python that increased picking efficiency by 22%, and optimized route planning for 80+ delivery routes using Gurobi that reduced fuel costs by 18%. These projects strengthened my ability to generate and validate hypotheses through controlled experimentation and apply machine learning techniques to improve real-time decision systems.

In my capstone project on demand forecasting, I developed a time-series forecasting model using XGBoost and LLM-extracted features from unstructured demand notes that achieved 14% lower MAPE compared to baseline ARIMA on a 10K+ SKU dataset, and deployed it to a cloud function serving 500+ daily predictions. This demonstrates my ability to select features, build classifiers, and maintain models that drive measurable business results.

Across my internships in supply chain analytics and logistics optimization, I have consistently translated statistical analysis into measurable business outcomes — from USD120K in annual savings to 22% efficiency gains. This cross-sector experience demonstrates my ability to apply machine learning and hypothesis testing to diverse business problems, which I am eager to bring to Lane Crawford's retail analytics team.

I am available for the on-site schedule in Hong Kong and hold the right to work in Hong Kong. I would welcome the opportunity to discuss how my background in statistical analysis, machine learning, and A/B testing can contribute to Lane Crawford's data-driven decision-making and help measure the impact of your ongoing campaigns and retail initiatives.

Yours faithfully, Tony Cheung
